

## KTM BALL VALVES

### MATERIAL COMPATIBILITY

Complete material compatibility guide for the selection of the most appropriate trim materials

#### KEY

- A:** Excellent resistance - little or no change in mechanical properties or weight.
- B:** Good - In time there may be a deterioration in mechanical properties and/or a change in weight.
- C:** Poor - After a short period of time the material is attacked.
- U:** Unsuitable - Do not use.
- I:** Insufficient or no data on which to base a conclusive rating.

#### NOTE

The following information has been derived from published literature from plastics and polymer supplier and manufacturers. It is therefore intended as a guide only in selecting materials for specific sealing applications in our valves. As the seal material can be influenced by the concentration of the media, temperature, contact time and operating conditions, it must remain the 'users' responsibility for final material selection.

If in doubt we suggest that customers test seals under operating conditions to determine their suitability. No warranty is given against corrosion or erosion.
